As a Mechatronics Engineering graduate currently pursuing a Master's degree in Automation, Robotics, Mechatronics and Control (ARMAC) at Université Marie et Louis Pasteur in France, I am motivated to further develop my technical expertise while applying my knowledge to real engineering challenges.

Throughout my undergraduate studies, I actively sought professional experience alongside my academic work, gaining practical exposure to industrial automation, maintenance, control systems, and engineering design. These opportunities allowed me to develop a practical understanding of industrial environments, strengthen my problem-solving skills, and become familiar with engineering software and tools used to analyze, design, and troubleshoot technical systems.

Alongside this experience, I worked as a Robotics and Computer Vision Instructor, guiding students through hands-on projects involving Arduino, Raspberry Pi, Python, and OpenCV. This role strengthened not only my technical knowledge but also my communication, leadership, and ability to explain complex concepts clearly.

My interests extend across robotics, automation, embedded systems, computer vision, control, and mechanical design. Curious, adaptable, and proactive, I enjoy learning independently, exploring new technologies, and finding practical solutions to technical problems. I am eager to contribute to meaningful projects, work collaboratively with experienced teams, and continue developing as an engineer through new professional and academic opportunities.
